

Sound Re-Design - 3D Game Kit

Sarah Marchal
08/03/2026

Introduction

This document serves as a report on the advances in my work on the Sound Design project, in the context of the Ubisoft 2026 Mentorship Program.

More precisely, it is a re-design of the sound from an already existing game : Unity's 3D Game kit. The goals are :

1. Create a working structure between Wwise and Unity to ready the integration.
2. Create a list of sound files created by myself to be integrated into the game.

In short, I will assume the two jobs of creative sound designer and technical sound designer for this project.

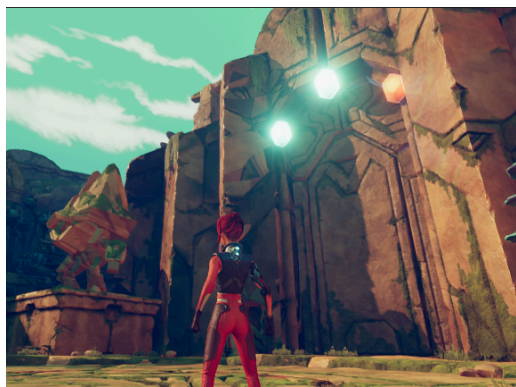

As the first step to prepare for this journey, I took the time to familiarise myself with Unity and Wwise, notably by following the entirety of the Wwise Fundamentals learning modules, followed by the Wwise Unity integration learning modules.

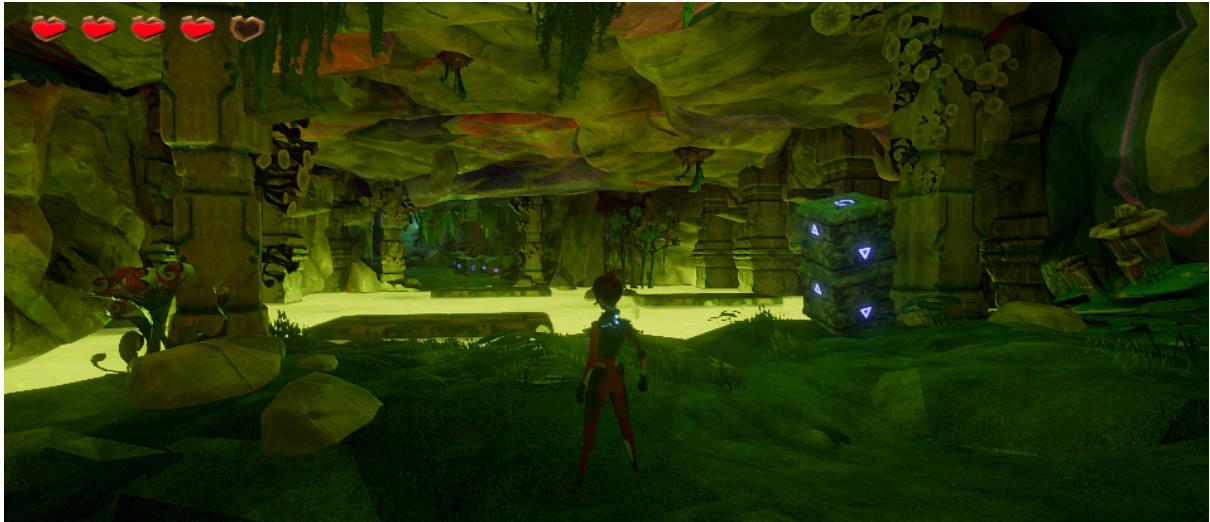

Artistic Direction

Existing Visual Art

The 3D Game kit comes with an already existent visual artistic direction.

This world is alien and Sci-Fi, mixing shades of mostly greens and reds. It has a sort of “lost civilisation” setup, with mossy stones and strange power with glowing lights, the ruins leading towards a dangerous underground passage.

Those visuals already give a certain amount of hints towards the artistic direction of the sound design. Another influence is the gameplay itself. Since we are dealing with an action game with monsters you need to hit, the factor of speed becomes important. The rhythm and energy of the sounds playing must match the energy of the fights.

In my brainstorming process, the following words came up :

- Sci-fi
- Alien
- Cute
- Mysterious
- Crashed ship
- Foreign planet
- Lost civilisation
- Powerful female lead
- Puzzle mechanics
- Technological magic
- Optimistic
- Light
- Saturated (high contrast between elements)
- Loud/Busy
- Action
- Low tension
- Guardian
- Cave
- Maze

References

Looking for other games and media with similar visual styles can let me take inspiration from the sound design they chose.

1. *Split Fiction*

Although the narrative brings out a lot more content for voices and dialogue, the visual style can be compared, the 3D platform elements are very present, and certain environments mix technology and fantasy just like ours.

The tension in this game is much higher, since the gameplay is most often focused on quick thinking and co-op puzzle solving rather than fighting, but for that exact reason the pacing and density of the sound space is in my opinion a very good model to strive towards for the 'action' aspect of our game.

In case you need to hear some gameplay from *Split Fiction*, do follow the link below towards this gameplay video with no commentary :

[▶ SPLIT FICTION Full Gameplay Walkthrough / No Commentary【FULL GAME】4...](#)

2. *The Legend of Zelda : Tears of the Kingdom*

Tears of the Kingdom is a modern jewel of a game that is hard not to take inspiration from, but even more so in this case.

The stylised “toon”-ish 3D, the lost civilisation trope with light glowing through mossy stone and showing old magical power, the attacking style through melee action, etc. Spending some time analyzing this game’s sound design will definitely be a big help.

In case you need to hear some gameplay from *The Legend of Zelda : Tears of the Kingdom*, do follow the link below towards this gameplay video with no commentary :

Work In Progress

Wwise integration structure

After connecting a new Wwise project to the Unity project, I started analysing all the assets, enemies, actions and animations, etc.

In parallel, I started preparing events and filing structures for the Audio and the Events.

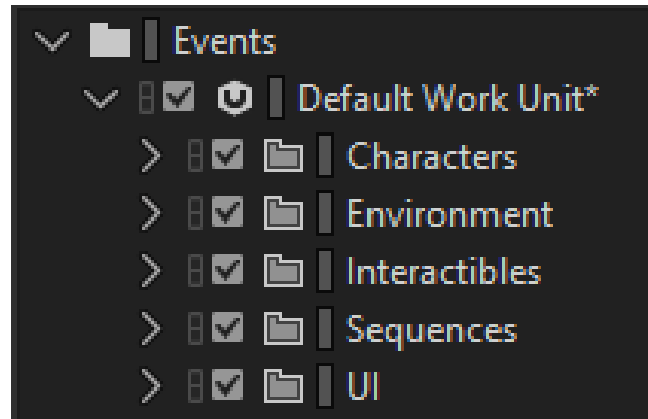

The original goal for this first mid-way milestone was to have finished the entirety of the integration part, making the second half of this mentorship entirely focused on creative sound design.

This structure is not nearly as finished as I wished it to be, since I am lacking most of the GameSyncs, as well as the tests within Unity with placeholder audios. It might change within the second part of this mentorship, but my objectives have slightly shifted (see the part on [Collaboration & Future planning](#) for more information).

Therefore, please do see this as a first draft of the integration structure.

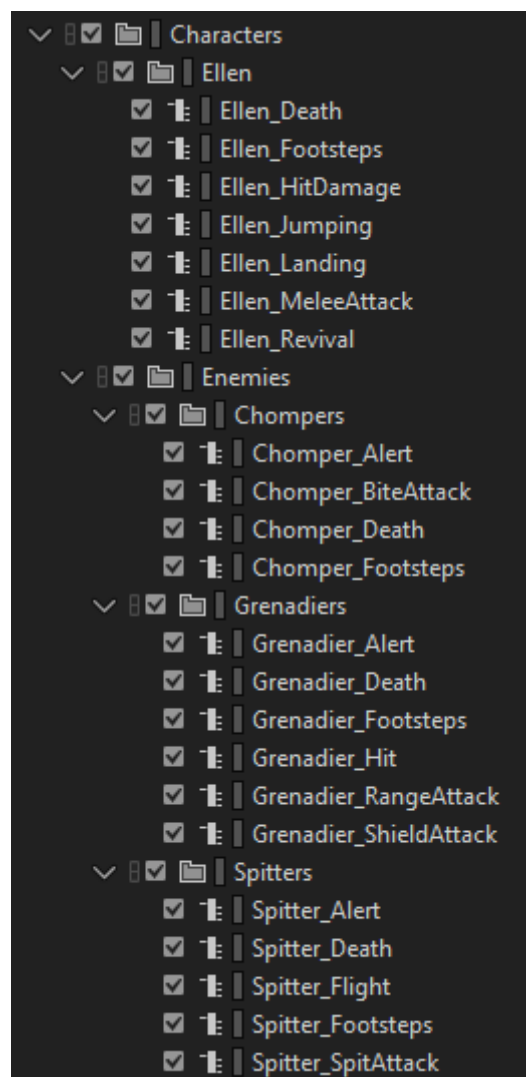

Events

I separated the Events into 5 main categories :

1. Characters

Ellen and all the enemy monsters

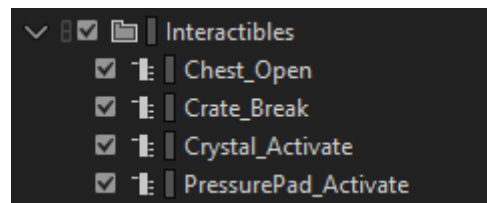

2. Environment

Everything related to ambiance and non-interactable objects.

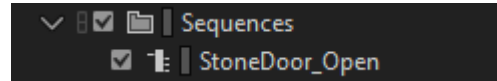

3. Interactibles

Crates, pressing pas, crystals, chests, every non-character object the player can interact with.

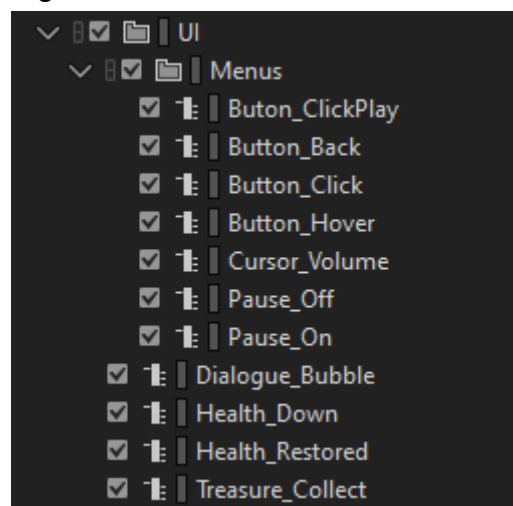

4. Sequences

Sounds related to cinematic sequences.

5. UI

Menu buttons and non-diegetic feedback sounds.

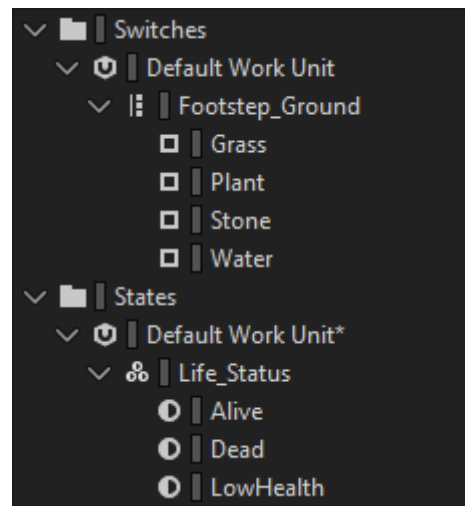

Game Syncs

Though most will be created further in the integration process, I did create the most important Game Syncs that were obvious enough to create.

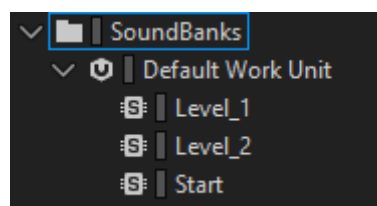

One is the switch group related to the ground, linked to the footsteps of our main character and matching each step with the material it is taking place in (Is Ellen running on grass? stone? water?).

The other is the State group linked to the life of our main character (is Ellen alive? dead? Low on life?).

Soundbanks

On the topic of the soundbanks, my current decision is to separate the soundbanks into a Start Menu bank, a Level 1 bank and a Level 2 bank. On each level load, the soundbank dedicated to this level would load along with it.

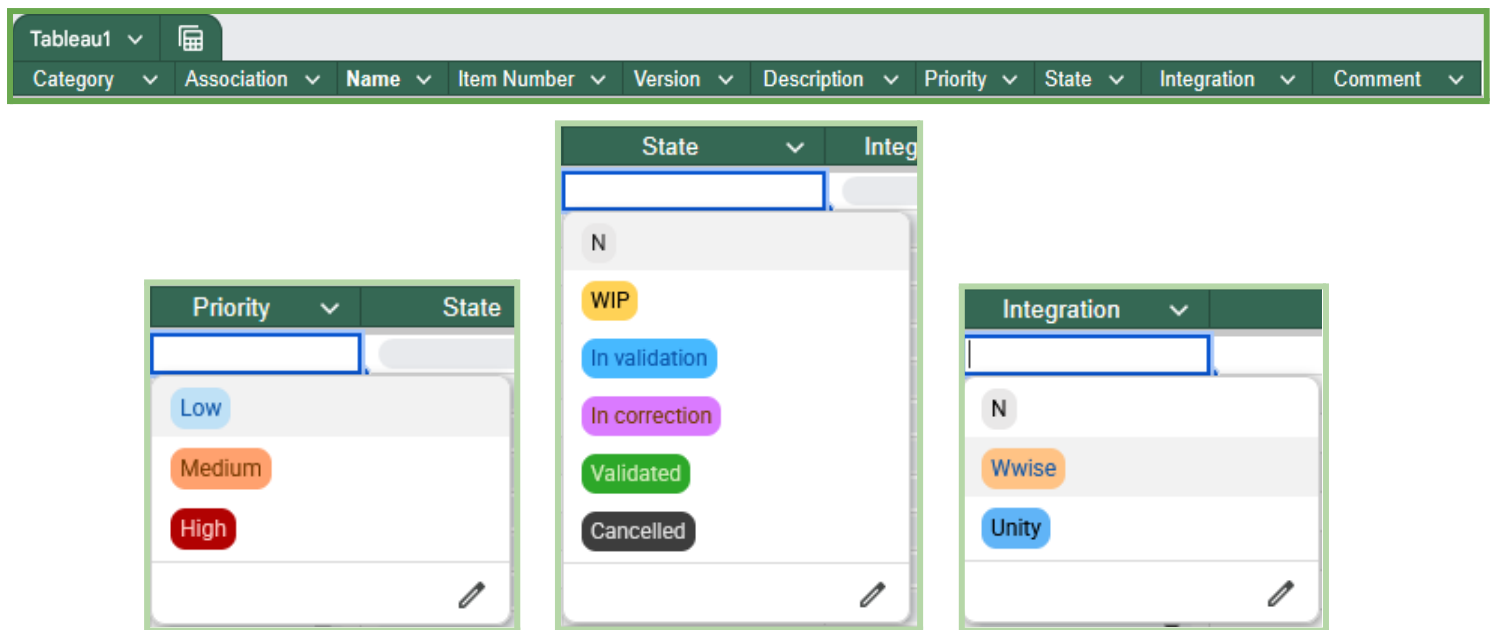

Sound list

The sound list was made using Google Sheets, using knowledge about the CAT naming system and my previous experiences with making sound lists for projects to prepare all the categories needed.

You can consult the sound list document within the github files, or via this link below :

[+ Sound List - Version 1](#)

The 3 pictures shown here are the possible choices I can make in the scroll menu of each case of the mentioned column.

They let me track my tasks easily, and can also serve as a communication tool with potential coworkers (letting them know what sounds are ready to be used, or letting them edit the priority of certain sounds depending on the production needs for example).

There are 2 sheets in this document, one dedicated to the audio library and one dedicated to the Wwise elements (events, game syncs, etc.).

Collaboration & Future planning

It was decided a short time before this mid-length milestone that a collaboration would be established between myself and Rita, another Mentee on the audio track. Both our mentors had discussed about our difficulties, and came up with the idea of cooperating under specific conditions :

- Each week, each mentee (me and Rita) will choose a different topic to work on within an established list (UI, interactibles, Space transitions, etc.)
- For the duration of the week, this topic becomes the sole topic this mentee will work on, from creating the sounds to integrating them
- At the end of the week, the mentee will prepare a document about the process, workflow, methodology for the sound integration, and share that document to the other mentee. This document will need to be written in a professional way, as to simulate teamwork communication within a professional sound design team.

The collaboration being quite new, I cannot currently give a strict planning of what tasks will be done and when, but this weekly schedule is a basis we both agreed on.

We do not think that the allocated time will make it possible to redesign the entirety of this virtual world. By proceeding block by block in this way each week, we will at least have a clear workflow on Unity and Wwise, we will be able to present quantifiable work at the end of this program with the possibility to progress further afterwards, and we will be able to present as a bonus the teamwork skill we will have put in place with Rita.

My personal objectives as of this time are :

- 1. Start creating and importing sounds.**
- 2. Organise a naming system and a sound library for this game.**
- 3. Organise with Rita for the first week and agree on our first topic.**
- 4. Explore the possibility of Ambisonic/Binaural sound for the ambiance.**
